

Figure 5E — Partial Spearman: CLR vs Dysbiosis Score | group_id

CLR–taxon and dysbiosis–score residuals after regressing out group_id (partial Spearman). $y = -\log_{10}(\text{BH-adj. } p)$; labels = guild members + ML top-20 taxa + top 5 promoting/protecting (visual threshold $\text{padj} < 0.05$; CSV `sig` column uses $\text{padj} < 0.2$). $n = 18$ samples.
